Cohort-Mean Descriptive Form

$$W_{\text{dia}} = 0.248 D_{\kappa} W_{\text{dia}} + 1.075 D_{\beta_N} W_{\text{dia}}$$

$$-1.070 D_{\beta_N} \kappa - 0.0150 D_{\beta_N} l_i$$

$$-0.0106 q_{95} / \kappa + 0.0509 \beta_N + 0.893 \kappa + \varepsilon$$

62 discharges · shared support · discharge-specific coefficients

b Coefficient Heterogeneity Audit

q_{desc}

62 discharge-specific coefficients

Decision rule:
Resolved if between-discharge
variation persists beyond
within-discharge uncertainty

Histogram + KDE on native scales; diamond: random-effects mean μ_{REML} .

$D_{\beta_N} l_i$ is resolved because its between/within ratio is 3.75 and $\hat{\sigma}_{\text{REML}}^2 > 0$;

$D_{\kappa} W_{\text{dia}}$ is not, because its ratio is 0.18 and the REML estimate collapses to $\hat{\sigma}_{\text{REML}}^2 = 0$.

Rec.

id	W_{dia}						
ratio	eee21 / cerTi10						6
ratio	$n_{e,\text{pod}}$ / cerTi3						5
ratio	I_{sig} / eec20						5
recip	1 / cerTi10						4
recip	1 / B_i						3
ratio	I_p / B_i						3
ratio	Da03 / cerTi3						3
prod	eee37 × eec39						3
prod	$n_{e,\text{pod}}$ × cerTi6						3
ratio	I_p / eec39						3
prod	P_{sig} × eec36						2
ratio	P_{338} / cerTi10						2
ratio	I_p / cerTi10						2
prod	Da04 × cerV8						2

Ratio Product Reciprocal Identity

Rows show the 15 terms recurring in at least two of the six 12-term supports; 20 singleton terms are omitted.

Ratio constructions dominate the recurrent set (8 / 15). All ratio and reciprocal terms shown here passed the frozen admissibility and range-support checks in the folds where they were selected.

d Target-Cross-Fitted Density Reconstruction

q_{rec}

Persistence lower error

earlier mean $\Delta = +0.0076$ · later mean $\Delta = -0.0726$ · 62 out-of-fold discharges

finite-object, target-cross-fitted qualification; not external validation
